

Intraoperative Treatment Options

Distal Femur Replacement

Proximal Tibia Replacement

Intracondylar Prosthesis
(illustration with tibial spacer)

Optional use of segments and spacers is possible.

- **High jump distance** for more safety during knee flexion
- **Stable stance** even in cases of soft tissue damage
- The aim is a **natural gait** in combination with utmost safety

Endo-Model SL
Knee Prosthesis System

Flexible – Anatomical – Expandable

Modularity

Endo-Model SL

Flexible – A wide choice of compatible implants

Anatomical – Designed for potential bone and soft tissue conservation

Expandable – Compatibility with LINK MEGASYSTEM-C

Flexibility

- **Highly modular** implant components
- **Intraoperative choice** between rotational and hinge versions when implant components are in situ
- **Extensive range of stems** for intramedullar implantation and for femur and/or tibia replacement

Anatomy

- Tibial plateau with 8° of dorsal slope for **increased joint stability**
- **Coupling and decoupling** in the joint plane with only low soft tissue distraction
- **Natural alignment** by means of 6° valgus from the joint line as well as physiological **patella motion and patella self-guidance**

Expansion

- **Compatibility** with the tumor and revision system LINK MEGASYSTEM-C
- **Harmonized interfaces** within the LINK SL-Knee Family
- **Wide range of options** for treating patients
